

I Claim,

1. A star finder, comprising:

a body having a shape that is suitable to be carried in the hand of a user, said body having a template-receiving end;

a template having a securing opening at a first end, said securing opening being sized and shaped to snugly receive said body at said template-receiving end, said template further including at least two viewing openings that are oriented in such a manner to align specific known and predetermined celestial bodies with the user's eye so that the user may benefit in locating such celestial bodies in the night sky.
